#### Next five days:

This week, rainfall will ease in coffee-producing areas that have been experiencing high rainfall volumes in recent weeks, between Espírito Santo, central and northern Minas Gerais, including the Zona da Mata region of Minas Gerais and the Cerrado region of Minas Gerais, and in the interior of Bahia. These areas are expected to experience longer periods of dry weather and rising temperatures. Moderate rainfall may occur in the producing areas of southern Minas Gerais, Alta Mogiana Paulista and northern Paraná, but the showers will be quite sparse and temperatures are also expected to rise. The heaviest rainfall this week is expected to hit producing areas in the state of Rondônia, where longer periods of closed weather are expected and rainfall volumes may exceed 100 mm.

### Weather/RainFall(mm) in Coffee regions

SES	0	0	0	165	228	-27
BA	0	0	0	188	99	91

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

### Extended Forecast:

The rains are expected to spread with greater intensity and scope over producing areas between Paraná, São Paulo and southern Minas Gerais next weekend. Even so, the rains are not expected to penetrate much into the interior of Minas Gerais and the clearer weather conditions will continue to predominate in much of the interior of Minas Gerais, Espírito Santo and Bahia, where the sequence of days of clearer weather should favor high temperatures that can lead to regional heat stress in some producing areas.
