Unchecked data from airport reports

Next five days:

In the second half of the week, rainfall will decrease in intensity over producing areas in the Southeast. Moderate episodes are still expected between northern Minas Gerais and Espírito Santo until the end of the week, but in other areas the episodes will become increasingly sparse and weak. Much more isolated and weak episodes are forecast for Bahia, southern areas and Triângulo Mineiro, São Paulo and northern Paraná. In the next five days, the highest rainfall volumes are forecast for the producing areas of Rondônia, where more than 70 mm of rain may fall in some locations, mainly in the north of the state. Temperatures will be milder between Minas Gerais and Espírito Santo, due to the persistence of humidity, while in the interior of São Paulo, northern Paraná and Triângulo Mineiro the heat tends to intensify, due to longer periods of dry weather, and temperatures that may exceed 32 °C are expected over the next few afternoons.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Next week, rainfall will increase again over the center-south of Brazil and moderate volumes are forecast for São Paulo, the south and Triângulo Mineiro, as well as the north of Paraná, which may receive volumes between 30 and 50 mm in the first days of April. Meanwhile, rainfall will reduce in the interior of Minas Gerais, Espírito Santo and Bahia.
