Unchecked data from airport reports

#### Next five days:

Starting Wednesday, the weather is expected to remain stable and no rain is expected in the coffee-producing regions of southern Minas Gerais and the Triângulo Mineiro region. Atmospheric conditions will remain favorable for field work, with clear skies and low humidity. In the coffee-producing areas of Espírito Santo and Bahia, showers are expected between Wednesday and part of Thursday. These volumes, estimated at between 10 and 15 mm, are beneficial for temporarily replenishing soil moisture, but are still insufficient to maintain adequate humidity levels in the medium term. The lowest temperatures of the period are expected to be seen in the early hours of Wednesday to Thursday, with minimums around 13 °C, due to the action of a cold air mass. Despite occasional cooling, there is no risk of frost. Maximum temperatures during the day are expected to reach around 24 °C. From Thursday onwards, early mornings tend to have milder temperatures, around 16 °C, with no risk of frost.

### Weather/RainFall(mm) in Coffee regions

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.  
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

### Extended Forecast:

The weekend will be marked by clear weather in coffee-producing areas, with no rain forecast. The beginning of next week should also remain mostly dry. The influence of a cold air mass could cause a temporary drop in maximum and minimum temperatures in the producing region, but without the risk of frost. From April 30th onwards, the early mornings will tend to be colder in the south of Minas Gerais.
