Next five days:

In the second half of the week, dry weather and rising temperatures will predominate over the coffee-producing areas of the center-south of the country. Much of the center-south of Brazil will experience a dry spell, that is, a period of dry weather with above-average temperatures until at least May 20. The cold front, which has advanced through the center-south of the country in recent days, will now generate more intense instability between Espírito Santo and southern Bahia, where episodes of rain in the form of more frequent and heavy showers are expected.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Until the middle of next week, dry weather will prevail over most of Brazil's coffee-producing areas. Occasional episodes are expected to affect areas in southern Bahia, Espírito Santo and Rondônia. In the producing areas of central-southern Brazil, the weather will change again in the last week of May, due to the advance of a new cold front.
