Unchecked data from airport reports

Next five days:

Throughout the weekend the weather should remain open for the coffee producing areas, the atmospheric blockage still contributes to the non-formation of clouds in the Central-West and Southeast regions of the country, the coffee producing areas in the South of Minas should have occasional clouds in the morning throughout Saturday and Sunday, but without the possibility of rain, the minimum temperature should be around 12°C in the South of Minas, while areas in the Triângulo Mineiro region should have weather more open throughout the week and maximum temperatures around 30°C and minimum temperatures around 15°C. Much of Espírito Santo should have open weather and high temperatures, temperatures around 33°C are expected for these regions. As for Rondônia, the state should have low-intensity rain over the weekend due to the humidity from the Amazon that will be channeled to the location and cause occasional instabilities, in addition, with the weather being cooler, maximum temperatures should be around 27° W.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

The atmospheric blockage is still acting over the Central West and Southeast areas of the country. This blockade inhibits the formation of clouds and leaves the weather more open in these areas. The last week was also marked by the effect of this blockade. Next week, milder temperatures are expected for the region, a new cold front should advance to break the blockade, after which the rains should be of low intensity but will not impact the coffee producing areas.
