Unchecked data from airport reports

Next five days:

Starting this Thursday, a cold front will advance from the coast of the South to the Southeast and should spread instability over the eastern strip of the region. However, the system should not significantly change the weather over the interior of the region. Over the coffee-producing areas between northern Paraná, São Paulo and Minas Gerais, only cloud cover and slight temperature fluctuations, especially at maximum temperatures, are forecast. Dry weather will continue to predominate and favor the harvest. Rain showers are forecast for the eastern strip of the region and isolated episodes may affect the producing areas of Espírito Santo.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Next week, especially starting on Tuesday, a new cold front will advance in a more organized manner through the center-south of the country, increasing the probability of occasional rain in producing areas between Paraná and parts of the Southeast. After this system passes, the advance of an air mass of polar origin will cause a sharp drop in temperatures over the center-south of the country. However, there is no forecast of extreme cold in the coffee producing areas. Temperatures should reach values slightly below 10°C in the coldest regions of southern Minas Gerais in the first days of June, with no risk of frost.
