Unchecked data from airport reports

Next five days:

Starting this Wednesday, occasional episodes of rain with moderate volumes are expected between eastern Minas Gerais, Espírito Santo and southern Bahia. In the other coffee-producing areas of the center-south of the country, instability will decrease and dry and cold weather will intensify, due to the action of a high atmospheric pressure system. Temperatures should be lower, both minimum and maximum, in the coming days. In the colder areas between São Paulo and southern Minas Gerais, minimum temperatures slightly below 10°C are expected in the second half of the week, but for now there is no risk of extreme cold, with the occurrence of frost.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Starting this weekend, a new cold front will advance through southern Brazil and by the beginning of next week it should once again spread some rain showers over areas between Paraná and São Paulo. However, this time the instability should not penetrate as far into the interior of the southeast region.
