Unchecked data from airport reports

Next five days:

The week begins with dry weather in most coffee-producing areas, while the most intense instability is concentrated in the extreme south and north of the country. In the coffee-producing areas of inland Brazil, this week will be marked by the intensification of a dry air mass and the gradual rise in temperatures. The cold will lessen in intensity and the minimum temperatures tend to be milder at dawn, while in the afternoons the heat should increase until the next weekend. Only areas in the south of Bahia and north of Espírito Santo should record occasional rains with low accumulated volumes.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

At the end of the week, a cold front will advance across the ocean, spreading instability over coastal regions in the Southeast, but this time the system should not cause significant changes in coffee-producing areas.
