Unchecked data from airport reports

Next five days:

A cold front is still spreading instability over the eastern strip of the Southeast. However, in most of the coffee-producing areas in the interior of the region, the system is not expected to bring significant rainfall. Dry weather will prevail in areas of Alta Mogiana in São Paulo and the interior of Minas Gerais, and temperatures will remain milder. Despite the impact of a new cold wave on the southernmost areas of the country, there is no forecast for major temperature fluctuations in the coffee-producing areas. The early mornings will continue to be cold, but without extreme temperatures with a risk of frost. Meanwhile, maximum temperatures tend to rise in most of the interior of the Southeast and milder between Paraná, São Paulo and the extreme south of Minas Gerais.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Next week, dry weather is expected to prevail over most coffee-producing areas. Only in regions of Espírito Santo and southern Bahia are rainy spells expected, which may occur with moderate intensity in coffee-producing areas and may impact activities in the fields.
