Unchecked data from airport reports

Next five days:

The weekend will be marked by predominantly dry weather and rising temperatures over most of the interior of Brazil, and conditions will be favorable for the coffee harvest. Occasional showers of rain may still hit producing areas in the Zona da Mata Mineira and Espírito Santo in the coming days. The cold air mass, which is acting over the center-south of Brazil, is losing strength, and there is no forecast for major temperature fluctuations in the coffee producing areas. The early mornings will continue to be cold, but without extremes with a risk of frost. Meanwhile, maximum temperatures tend to rise in most of the interior of the Southeast and milder in Paraná, São Paulo and the extreme south of Minas Gerais.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:
Next week, dry weather is expected to prevail over most coffee-producing areas. Only in regions of Espírito Santo and southern Bahia are rainy spells expected, which may occur with moderate intensity in coffee-producing areas and may impact activities in the fields.
