Unchecked data from airport reports

Next five days:

The effect of high atmospheric pressure should favor open weather in coffee producing areas. In the Espírito Santo region, the conilon coffee producing areas should experience some clouds throughout this Monday, these are low intensity clouds and should decrease throughout the day. In Minas Gerais, south of Minas and Triângulo Mineiro, Arabica-type coffee should have its second period marked by open time and a gradual increase in temperatures, milder temperatures are expected until mid-week and at the end of the week temperatures could reach at 26°C in these producing regions. This open weather is favorable for harvesting and drying coffee beans and should persist throughout the week. In Bahia the week should start with open weather and maximum temperatures should remain high in the region until the end of the week, in a way the open weather favors the harvest but it is an indication of attention in relation to water and thermal stress at the feet of coffee in the Bahia region.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

The week should be marked by open weather, the producing areas in the South of Minas should have maximum temperatures of around 26°C and minimum temperatures close to 12°C, there is no indication of temperature extremes for the region. In the Triângulo Mineiro, maximum temperatures may be greater than 30°C throughout this week, in addition, the weather should remain open, intensifying the agricultural dry period. In the producing region of Espírito Santo and Bahia, maximum temperatures are expected to become higher, with maximum temperatures reaching 32°C in the Bahia region. Next week is indicative of an intensification of dry weather for coffee producing areas.
