Unchecked data from airport reports

Next five days:

In the second half of the week, a new cold front will advance across the ocean near the coast of the center-south of the country. However, the system is expected to bring more significant rainfall over the interior of the southern region. The system is expected to move quickly away from the coast between Thursday and Friday and will not bring rain to coffee-producing areas in the South and Southeast. Cloud cover may remain variable, and temperatures may fluctuate slightly. For now, however, the weather should remain dry and favorable for harvesting conditions in most of the country's coffee-producing areas.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.						
Extended Forecast: No significant rainfall is expected in coffee-producing areas this month, nor are such sharp temperature fluctuations expected.
