Unchecked data from airport reports

Next five days:

This Friday, rain is expected to hit the eastern strip between São Paulo, Rio de Janeiro, the south, and the Mata Mineira region, due to the rapid passage of a cold front along the Southeast coast. Rain is not forecast for other areas, but humidity and cloud cover are expected to increase, and the coffee harvest is expected to be temporarily impacted. Dry weather will intensify again over the weekend, and temperatures will drop slightly, but intense cold is not forecast.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

A new cold front is expected to advance in the final days of July, early next week. Once again, this system is unlikely to bring significant rainfall to coffee-producing areas. However, it will be accompanied by a more intense cold air mass, which will cause a sharp drop in temperatures over the southernmost regions of the country. For now, forecasts indicate temperatures slightly below 10°C for coffee-producing areas in the South and Southeast, with no risk of frost.
