Unchecked data from airport reports

Next five days:

The weekend will be marked by firm weather, with a predominance of sunshine and wide temperature ranges in the coffee producing areas. Despite the early morning cold, there is no risk of extremes and weather conditions will remain favorable for harvesting and drying coffee beans.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

At the beginning of next week, a cold front will advance through the south of Brazil and from July 30th this system should advance towards the Southeast coast. Especially between July 31st and August 1st, the system should spread instabilities over the Southeast region and there is a probability of rain episodes occurring over producing areas of São Paulo, the south and the Mata Mineira zone, Rio de Janeiro and even the Holy Spirit. The rains will be very isolated and weak, but they should make the weather more humid and closed, a condition that should momentarily paralyze activities in the field, including the coffee harvest. Instability should reduce over the Southeast region in the first days of August, while rains should advance to the producing areas of southern Bahia. Accompanying the passage of the cold front, a new mass of cold air should cause a decline in temperatures, in the first week of August, over the center south of the country. The cold should increase during the early hours of the morning, especially in the highest areas of Minas Gerais, but for now there is no risk of frost.
