Unchecked data from airport reports

Next five days:

Areas of instability are advancing over the Southeast this Tuesday, bringing more unstable weather to coffee-producing areas in the eastern part of the region. No significant rainfall is forecast for coffee-producing areas, but cloud cover is expected to remain variable, and some occasional rain may occur, especially in producing areas of Paraná, southern São Paulo, and the Mata Mineira region. In the second half of the week, instability will spread over Espírito Santo and southern Bahia. Furthermore, another system will move into the center-south of the country in the second half of the week, once again spreading more intense instability over the South. But between Friday and the weekend, the system is also expected to spread instability over São Paulo and southern Minas Gerais, bringing more unstable weather to coffee-growing areas. As for temperatures, no major fluctuations are forecast with the passage of this first cold front of the beginning of the week. Temperatures are expected to fluctuate more this coming weekend, especially in the early hours of Saturday and Sunday. Temperatures are expected to drop below 10°C in many locations between Paraná, São Paulo, and southern Minas Gerais. However, there is no forecast of extreme cold or risk of frost.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Next week, dry air will intensify and predominate over the producing areas of inland Brazil. The week should start off cooler, but temperatures will gradually rise again as the week progresses.
