Unchecked data from airport reports

Next five days:

This Tuesday, the passage of a new cold front is expected to spread instability across the country's interior. Rain is expected to hit mainly the interior of Mato Grosso do Sul and western São Paulo. However, the coffee-producing areas of southern Minas Gerais and the Triângulo Mineiro region are not expected to be impacted, with the weather remaining stable in the region. Starting Wednesday, the scenario changes: dry and hot weather is expected to prevail over the coffee-growing areas, favoring the harvest. However, this pattern could bring higher temperatures, with highs approaching 35°C in the Triângulo Mineiro region and part of Alta Mogiana in São Paulo.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Next weekend, the formation of a low pressure area near the Southeast coast is expected to intensify rainfall over producing areas in Espírito Santo and eastern Minas Gerais. Instabilities are expected to increase starting Friday, but more widespread and heavy rainfall is expected mainly on Saturday, especially in Espírito Santo, Zona da Mata, and Northeast Minas Gerais. Some isolated episodes may extend to the interior of Minas Gerais and even to São Paulo.
