Next five days:

By the end of the week, dry and hot weather will intensify over coffee-growing areas. Daytime temperatures will continue to rise and are expected to lead to heat stress, as highs are expected to reach close to 35°C in some areas between the Alta Mogiana region of São Paulo, the Triângulo region, and the Cerrado region of Minas Gerais. Occasional rain showers are expected to hit the area between Espírito Santo and the extreme south of Bahia in the second half of the week. In Rondônia, rain showers are expected to be more frequent and moderate in intensity.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Over the next week, the advance of a cold front is expected to once again disrupt the weather over producing areas in the Southeast. Starting Tuesday, isolated, moderate-volume rain is expected over several producing areas in São Paulo, Minas Gerais, and Espírito Santo. This rain may occur in the form of thunderstorms, but it will still be uneven and unlikely to cover all producing areas.
