Unchecked data from airport reports

Next five days:

Between Friday and Saturday, the weather will remain quite unstable over the coffee-producing areas of south-central Brazil. Rain is expected to become increasingly widespread with moderate intensity, and maximum temperatures will decline. Some areas between Alta Mogiana Paulista, southern Minas Gerais, and the Zona da Mata region are expected to receive more than 50mm of rain by the beginning of next week. For now, dry weather continues to predominate in northern Minas Gerais, northern Espírito Santo, and the interior of Bahia.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Next week, a corridor of humidity will form over the interior of Brazil. Until the middle of the week, the rains will continue to be persistent and heavier over coffee-producing areas between the South and Southeast. In the second half of the week, the corridor should establish itself more over the northern half of Brazil, and the rains should also spread over the northernmost areas of the Southeast and the interior of Bahia.
