Unchecked data from airport reports

Next five days:

Most of the week will be marked by longer periods of sunshine over the producing areas of the Southeast. In the producing regions between Bahia, Espírito Santo and northern Minas Gerais, rain episodes are still expected in the form of isolated and light to moderate showers, but in the meantime new instabilities are beginning to gain strength over the extreme south of Brazil and should give rise to a cold front over the region. This system will advance in the second half of the week towards the Southeast, organizing more intense and widespread rains over the producing areas of this region, especially between Friday and the weekend. Until then, longer periods of clear weather are expected, with predominance of sun and rising temperatures, between the north of São Paulo and the south-central part of Minas Gerais.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Starting this weekend, a humidity corridor will establish itself over the northern half of Brazil, organizing the most intense instabilities over central Brazil and producing areas between Minas Gerais, Espírito Santo and the Northeast. Meanwhile, in the center and south of Brazil, dry weather will intensify, including in producing areas between Paraná, São Paulo and southern Minas Gerais.
