Unchecked data from airport reports

Next five days:

A corridor of humidity is organizing the most intense instabilities over the northern half of Brazil over the next few days, so persistent and heavy rains are expected in areas between Espírito Santo, northern Minas Gerais, and Bahia. This condition will persist at least until Friday, and precipitation volumes will be quite high in these areas. Meanwhile, in south-central Brazil, dry weather will prevail for most of the week, and the heat will intensify during the afternoons, with highs exceeding 30°C, and in some locations between northern São Paulo, the Minas Gerais triangle, and the Cerrado, highs may approach 35°C.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day.
That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Over the weekend, dry weather will continue to prevail over the coffee-producing areas of south-central Brazil, and instability will also decrease between Bahia and Espírito Santo. Early next week, a new cold front is expected to move along the Brazilian coast, significantly altering the weather in the interior of the Southeast region.
