Unchecked data from airport reports

Next five days:

The South Atlantic Convergence Zone (SACZ) continues to organize heavy and persistent rains over the interior of Brazil at least until Wednesday. Heavy rains are still expected, which could cause disruptions and paralyze agricultural activities in the coffee-producing areas of the Cerrado, Zona da Mata Mineira, and the interior of Espírito Santo. Isolated showers will affect southern and western Bahia, Alta Mogiana, southern Minas Gerais, and the Triângulo Mineiro region. From Thursday onwards, rainfall will decrease in the coffee-growing areas, becoming increasingly scattered, and temperatures will rise again.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

The South Atlantic Convergence Zone (SACZ) will weaken during the second half of the week. Instabilities will regain strength over the extreme south of Brazil and should channel moisture to this area, while in the interior of Brazil, especially between the Southeast and Northeast, during sunny periods, humidity will increase and maximum temperatures tend to rise rapidly until the end of the week.
