Unchecked data from airport reports

Next five days:

On Wednesday, the formation of a low-pressure system near the Southeast coast will further reinforce the instability and frosts caused by the South Atlantic Convergence Zone (SACZ), an intense corridor of humidity extending from the North, through the Midwest, to the Southeast. Heavy and persistent rainfall is expected, especially between São Paulo and Minas Gerais. Some areas are expected to receive rainfall amounts exceeding 100mm by the end of the week. The rains, accompanied by occasional episodes of strong winds and hail, may cause localized damage to crops, but generally tend to be beneficial for maintaining high soil moisture. Areas in the midwest of Bahia, northern Minas Gerais, and Espírito Santo should experience more isolated and moderate events.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.						
Extended Forecast: Over the weekend, unstable weather patterns will remain more prevalent in producing areas between São Paulo and southern Minas Gerais, while areas between northern Minas Gerais, Espírito Santo, and Bahia are expected to receive little rain between the weekend and next week.
