Unchecked data from airport reports

#### Next five days:

The presence of a low-pressure area near the southeastern coast is further reinforcing the moisture corridor over the interior of Brazil, and in the coming days rainfall volumes are expected to increase over coffee-producing areas between São Paulo and Minas Gerais. Especially between Saturday and Tuesday, significant volumes are expected, potentially exceeding 150 mm in the Alta Mogiana region of São Paulo, the Triângulo Mineiro region, southern Minas Gerais, and Rio de Janeiro. The heavy rains are expected to cause disruption in some areas, mainly due to landslides and flooding. In agricultural areas, the soil will remain quite saturated. Between Espírito Santo, northern Minas Gerais, and the interior of Bahia, more isolated episodes of rain are expected, which may be heavy in some places, but widespread and voluminous rainfall is not expected in the next five days. Temperatures will be much milder in the areas between São Paulo and Minas Gerais due to the overcast weather.

### Weather/RainFall(mm) in Coffee regions

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

### Extended Forecast:

Rainfall is expected to decrease in coffee-producing areas starting in the middle of next week. During the Carnival holiday, prolonged periods of dry weather and heat waves are expected in the main coffee-producing areas between the Southeast and the interior of Bahia.
