Unchecked data from airport reports

Next five days:

In the second half of the week, areas of instability continue to spread rain over the coffee-growing regions of São Paulo and Minas Gerais. Some areas between Alta Mogiana and southern Minas Gerais may receive more than 30mm of rain by Friday. Over the weekend, some isolated episodes are still possible, but they will be weaker and less severe. In the areas of Espírito Santo and between southern and western Bahia, conditions are favorable for isolated episodes, generally with low accumulations.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

At the beginning of next week, dry weather will intensify and prevail in most coffee-producing areas, but in the second half of the week, the passage of a new cold front will bring rain back to the producing areas of the south-central region.
