Next five days:

A cold front is spreading significant instability over coffee-producing areas in southeastern Brazil, and rainfall is expected to reach areas between northern São Paulo, Minas Gerais, and Espírito Santo by Friday. However, over the weekend, the instability is expected to intensify and concentrate more over the northern half of Minas Gerais and Espírito Santo, where accumulated rainfall could exceed 100 mm in some locations. In Bahia, rainfall will continue in a somewhat more isolated manner, but is also expected to increase over the weekend, especially in the southern and western areas of the state.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

The start of next week will be marked by an intensification of dry weather over the interior of Brazil, and in the coffee-producing areas of the south-central region of the country, we will have predominantly clear skies and rising temperatures. Meanwhile, the start of next week will be wetter in the northernmost areas of the country, including coffee-producing areas of Bahia and northern Espírito Santo.
