

A week of dry weather and large temperature variations across most coffee-growing areas.

Current Weather (14-04)

	PAR	SSP	AMOG	BMOG	SMG1	SMG2	CER	ZM	NES	SES	BA
MN	21	20	18	20	19	18	18	20	24	19	19
MX*	26	27	28	27	27	27	28	27	27	27	29

Unchecked data from airport reports

Next five days:

The most intense instabilities continue to form over the South, North, and Northeast regions, while in central Brazil, dry weather intensifies this week. In the main coffee-producing areas between the Southeast and Bahia, dry weather will prevail at least until the end of the week, and temperatures will have a wide range; that is, the mornings will remain slightly cooler, but the afternoons will become increasingly warmer, with highs close to 30°C. In the producing areas of Rondônia, isolated and moderate showers are forecast.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Rain is expected to return to producing areas in the Southeast after April 20th. However, isolated episodes with low accumulation are still predicted between São Paulo and southern Minas Gerais.
