Unchecked data from airport reports

Next five days:

This Friday, the most intense and widespread instability will affect the north-central region of the country. In the South, a cyclone far out in the ocean and a cold front will spread localized instability. Meanwhile, hot, dry air will prevail in most of the Southeast and Bahia. During the weekend, the cold front will advance from the South towards the Southeast, well away from the coast, but will increase instability between São Paulo and southern Minas Gerais, making localized rain possible. In addition to being localized, the rains will be brief and with low accumulations. In the other coffee-producing areas between the Southeast and Bahia, dry weather will prevail at least until the end of the week, and the afternoons will become increasingly hot, with highs close to 30°C, which favors fieldwork and the ripening of coffee beans.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Next week, dry weather should continue to prevail over most coffee-growing areas. Only at the turn of the month is a more significant change in the weather expected over the south-central region of the country.
