Unchecked data from airport reports

Next five days:

The week begins with significant instability affecting the eastern strip between the Southeast and Northeast regions. Therefore, coffee-producing areas in eastern Minas Gerais, including the Zona da Mata, Espírito Santo, and southern Bahia will start the week with wetter weather, considerable cloud cover, and sporadic showers, which may impact harvesting activities. This wetter weather pattern with showers is expected to persist at least until Thursday. In the interior of the Southeast and interior of Bahia, the weather will remain drier, with sunny spells and higher daytime temperatures, which will favor fieldwork.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Starting Friday, instability will decrease over the eastern part of Brazil, and dry weather will prevail in these areas as well. New changes are expected from the middle of next week, when a new cold front should advance along the Southeast coast, spreading rain over the region's producing areas.
