Unchecked data from airport reports

Next five days:

A cold front advancing along the southeastern coast is still generating instability over parts of the region at the start of this week. Between Monday and Tuesday, the instability should cause isolated episodes of rain over coffee-producing areas from Alta Mogiana Paulista, southern Minas Gerais, Zona da Mata Mineira, to Espírito Santo. From Wednesday onwards, the instability will be concentrated between the far north of Espírito Santo and southern Bahia. Meanwhile, over the south-central part of the country, the advance of a new cold front will again spread rain from Friday onwards. This system should cause new episodes of rain over producing areas of São Paulo and southern Minas Gerais between the weekend and the beginning of next week. As for temperatures...

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Throughout the next week, instability will continue to affect the Southeast region, and moderate rainfall events are forecast between southern São Paulo, the Zona da Mata region, and the Triângulo Mineiro region. Until May 20th, rainfall is also expected to occur more frequently over areas between Rio de Janeiro and Espírito Santo.
