Unchecked data from airport reports

Next five days:

A cold front advancing along the southeastern coast is still generating instability and isolated episodes of rain over coffee-producing areas in the east, especially in the Zona da Mata region of Minas Gerais, and between Rio de Janeiro and Espírito Santo. From Wednesday onwards, the instability will be concentrated between the far north of Espírito Santo and the south of Bahia. Meanwhile, over the south-central part of the country, the advance of a new cold front will again spread rain from Friday onwards. This system should cause new episodes of rain over producing areas of São Paulo and southern Minas Gerais between the weekend and the beginning of next week. As for temperatures, cold weather will predominate over the south-central part of the country at the beginning of the week, and especially until Wednesday, minimum temperatures are still expected, which may be around or slightly below 10°C in the coldest areas between São Paulo and southern Minas Gerais. However, there is no forecast for extreme cold or risk of frost that could damage the crop.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Throughout the next week, instability will continue to affect the Southeast region, and moderate rainfall events are forecast between southern São Paulo, the Zona da Mata region, and the Triângulo Mineiro region. Until May 20th, rainfall is also expected to occur more frequently over areas between Rio de Janeiro and Espírito Santo.
