Next five days:

The passage of a cold front along the Southeast coast continues to generate significant instability over the region's coffee-producing areas. Between this Friday and Monday (15), moderate and locally strong rain is expected between São Paulo and southern Minas Gerais. Cloud cover is expected to increase over the weekend, and there is a chance of isolated and weaker rain in the Cerrado region, central Minas Gerais, and Espírito Santo. Due to the unstable weather, temperatures will remain lower, but during the early mornings, no extreme cold is expected, and there is no risk of damage to crops. The persistence of humidity, in addition to impacting field activities, may harm the quality of the beans.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Over the course of next week, instability is expected to concentrate over Espírito Santo and southern Bahia, while in other producing areas of the central-south, instability is expected to decrease and dry weather will return to predominate from Tuesday onwards. The following weekend, starting on the 19th, there is a forecast for more widespread rainfall events over producing areas of São Paulo and southern Minas Gerais.
