Next five days:

The week begins with a cold front affecting the southeastern coast. The system is spreading instability over the state of São Paulo, southern and eastern Minas Gerais, and Rio de Janeiro. Moderate rainfall is expected in these areas, especially on Monday. From Tuesday onwards, rainfall will be more coastal, with weaker or occasionally moderate rain showers expected between eastern São Paulo, Rio de Janeiro, eastern Minas Gerais (including the Zona da Mata region), and Espírito Santo. These conditions should persist at least until Thursday. Meanwhile, in other inland areas of the Southeast, dry weather should strengthen throughout the week, again favoring fieldwork. Temperatures should remain low in the coming days, but no extreme cold is forecast for coffee-producing areas. Minimum temperatures should range from 12 to 15°C in areas between São Paulo and southern Minas Gerais.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Starting next Friday, a new cold front will advance through south-central Brazil, and once again the system is expected to cause increased instability, especially over the state of São Paulo, where moderate precipitation is forecast between Friday and the weekend. However, a more organized system that should move into the interior of the southeast is expected during next week.
