Unchecked data from airport reports

Next five days:

Starting this Friday, a new cold front will advance through south-central Brazil, and once again the system should cause increased instability, especially over the state of São Paulo, where moderate rainfall is expected between Friday and Saturday. On Sunday, the instability will decrease, but a more organized and intense system will advance at the beginning of next week and should spread more widespread rain from Monday onwards over most of the coffee-producing areas of São Paulo and southern Minas Gerais. Unstable weather with moderate rainfall should persist for most of the week, especially over São Paulo.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

In the last days of the month, instability will decrease, and the advance of a polar air mass will cause drier weather conditions, but also a sharp drop in temperatures in areas between São Paulo, the south, and the Zona da Mata region of Minas Gerais. Many areas will face cold temperatures below 10°C, however, for now the risk of frost is low in coffee-growing areas.
