Next five days:

This week begins with the formation of a new cold front in southern Brazil, a system that on Monday will spread moderate to heavy rainfall across the three southern states of the country. By the end of the day, the instability will approach the state of São Paulo, but it is mainly from Tuesday onwards that the cold front will act more effectively over the Southeast, impacting coffee-producing areas. Between Tuesday and Wednesday, more widespread rainfall with high volumes is expected over coffee-producing areas. During these two days, some producing regions of São Paulo, southern Minas Gerais, and the Triângulo Mineiro region may receive more than 50 mm of accumulated rainfall. The rain impacts field activities, causing delays in the coffee harvest and also harming the quality of the beans in some areas. From Thursday onwards, the rain will decrease, but episodes of moderate showers are still expected in areas of the eastern strip of the Southeast, including eastern Minas Gerais and also the interior of São Paulo. The highlight of the second half of the week will be the advance of a cold air mass, which will contribute to a sharp drop in temperatures over south-central Brazil. In coffee-producing areas, temperatures should decrease significantly, but for now there is no indication of frost. Minimum temperatures in general should vary around 12°C between the interior of São Paulo and southern Minas Gerais, but in some colder regions, minimum temperatures may drop slightly below 10°C in the early mornings of Thursday and Friday.

Attention: Each data above is the accumulated rainfall in the last 24 hours, collected from official meteorological stations, at 12:00 GMT (9:00 am local time) of the day. That values are interpolated to a grid point format, and indicates the mean rainfall of each region.

Extended Forecast:

Between Friday and the weekend, rainfall will decrease in the coffee-producing areas of the Southeast, with isolated episodes expected to concentrate between Espírito Santo and southern Bahia. This break in the rain will be short-lived in parts of the Southeast, and at the beginning of next week, the advance of a new system will once again spread rain across the interior of São Paulo and the eastern strip of the Southeast.
