🔗 NEXT 5 DAYS ANALYSIS

On Tuesday, the presence of a cold front over the ocean, near the coast of Espírito Santo and southern Bahia, continues to favor the formation of strong instabilities and heavy rainfall in northern Espírito Santo, northern Minas Gerais, and inland Bahia. In the coffee-producing areas, higher volumes are expected to increase soil moisture but may also cause interruptions in field activities. Rainfall will also reach the Cerrado regions, with greater intensity on Tuesday. On Wednesday, precipitation will be more localized between Espírito Santo and Bahia, though there remains a risk of heavy rain, especially in northern Espírito Santo. From that day onward, new instabilities will advance inland Brazil, bringing showers to coffee-producing areas in São Paulo and southern Minas Gerais. In the second half of the week, instabilities are expected to intensify, and rainfall is likely to spread throughout the country's South-Central region, especially between Thursday and Friday. High rainfall volumes are anticipated in São Paulo, southern Minas Gerais, and the Triângulo Mineiro. Precipitation may be stormy, with wind gusts and possible hail. Temperatures are expected to drop in the South-Central region due to the influence of a somewhat cooler air mass. Further north, humid conditions should keep temperatures mild, below the values recorded in recent days.

🔗 EXTENDED FORECAST ANALYSIS

Over the weekend, rainfall is expected to spread across most coffee-producing areas in the Southeast as well as southern Bahia. Significant volumes are again expected in northern Minas Gerais, Espírito Santo, and southern Bahia. The week is forecasted to be quite humid, promoting a more even distribution of soil moisture. However, the frequent rainfall may cause interruptions in field activities.
